Instructions For Use Thermochromic Paint

Before use, stir well the container filled with thermochromic (color changing) paint.

When work with the thermochromic paint wear lab coat and use latex gloves.

Do not mix thermochromic paint of different brands or colors.

Apply the paint on sheet or volumetric object using small roller or brush.

The coated surface should be **compatible*** to the thermochromic material and free of dust and impurities.

Wait until thermochromic paint coating dries up.

Heat the surface, which is covered with the paint to see the thermochromic effect.

Do not overheat the coated surface.

Keep the thermochromic paint at a cool, dark, and dry place. Do not freeze it!

Do not leave the bottle open – the thermochromic paint will irreversibly dry up.

Avoid exposing the thermochromic paint to direct sun light.

**Longer heating may destroy the fine microstructure of thermochromic liquid ink.
Overheating may cause fire!**

*** The surface subject of coating should be free of any traces of salts, organic solvents, acids, and alkaline bases. All of these chemicals may destroy the fine microstructure of the thermochromic liquid paint.**
